## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 8\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotException AtTheRateException DomainException

A typical email address should have a "." character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

### ***Input Format***

The first line of input contains the email to be validated.

### ***Output Format***

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

### **Sample Test Case**

Input: sample@gmail.com

Output: Valid email address

### **Answer**

```
// You are using Java
import java.util.Scanner;

// Custom Exception for dot-related errors
class DotException extends Exception {
    public DotException(String message) {
        super(message);
    }
}

// Custom Exception for '@' usage errors
class AtTheRateException extends Exception {
    public AtTheRateException(String message) {
        super(message);
    }
}

// Custom Exception for invalid domain errors
class DomainException extends Exception {
    public DomainException(String message) {
        super(message);
    }
}

// Main class (must match filename: Main.java)
public class Main {

    // Method to validate the email address
    public static void validateEmail(String email) throws DotException,
    AtTheRateException, DomainException {

        // Check if there is exactly one '@' and used properly
```

```

int atCount = email.length() - email.replace("@", "").length();
if (atCount != 1 || email.startsWith("@") || email.endsWith("@") ||
email.contains("@@")) {
    throw new AtTheRateException("Invalid @ usage");
}

// Check for invalid dot usage
if (email.endsWith(".") || email.startsWith(".") || email.contains("..")) {
    throw new DotException("Invalid Dot usage");
}

// Ensure there is at least one '.' after '@'
int atIndex = email.indexOf("@");
int dotIndex = email.lastIndexOf(".");
if (dotIndex < atIndex) {
    throw new DotException("Invalid Dot usage");
}

// Validate domain name
String domain = email.substring(dotIndex + 1);
if (!(domain.equals("com") || domain.equals("in") || domain.equals("net") ||
domain.equals("biz"))) {
    throw new DomainException("Invalid Domain");
}
}

// Main method
public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    String email = sc.nextLine(); // Read input email
    sc.close();

    try {
        validateEmail(email);
        System.out.println("Valid email address");
    }
    catch (DotException e) {
        System.out.println("DotException: " + e.getMessage());
        System.out.println("Invalid email address");
    }
    catch (AtTheRateException e) {
        System.out.println("AtTheRateException: " + e.getMessage());
    }
}

```

```
        System.out.println("Invalid email address");
    }
    catch (DomainException e) {
        System.out.println("DomainException: " + e.getMessage());
        System.out.println("Invalid email address");
    }
}
}
```

**Status :** Correct

**Marks : 10/10**
